DASH PLATFORM TUTORIALS

Example apps, from SDK calls to product flows.

Four browser examples show how the same Platform SDK patterns become NFT-style collectibles, notes, ratings, and proof-of-existence records on testnet. Dashnote Starter appears as the minimal path into Dashnote.

DashMint Lab

NFT-style cards and token payments.

Dashnote

Compatible starter-to-polished notes path.

DashRate

Reviews, counts, and history queries.

DashProof Lab

Local hashes anchored as proofs.

TOKENS AND NFT-STYLE DOCUMENTS

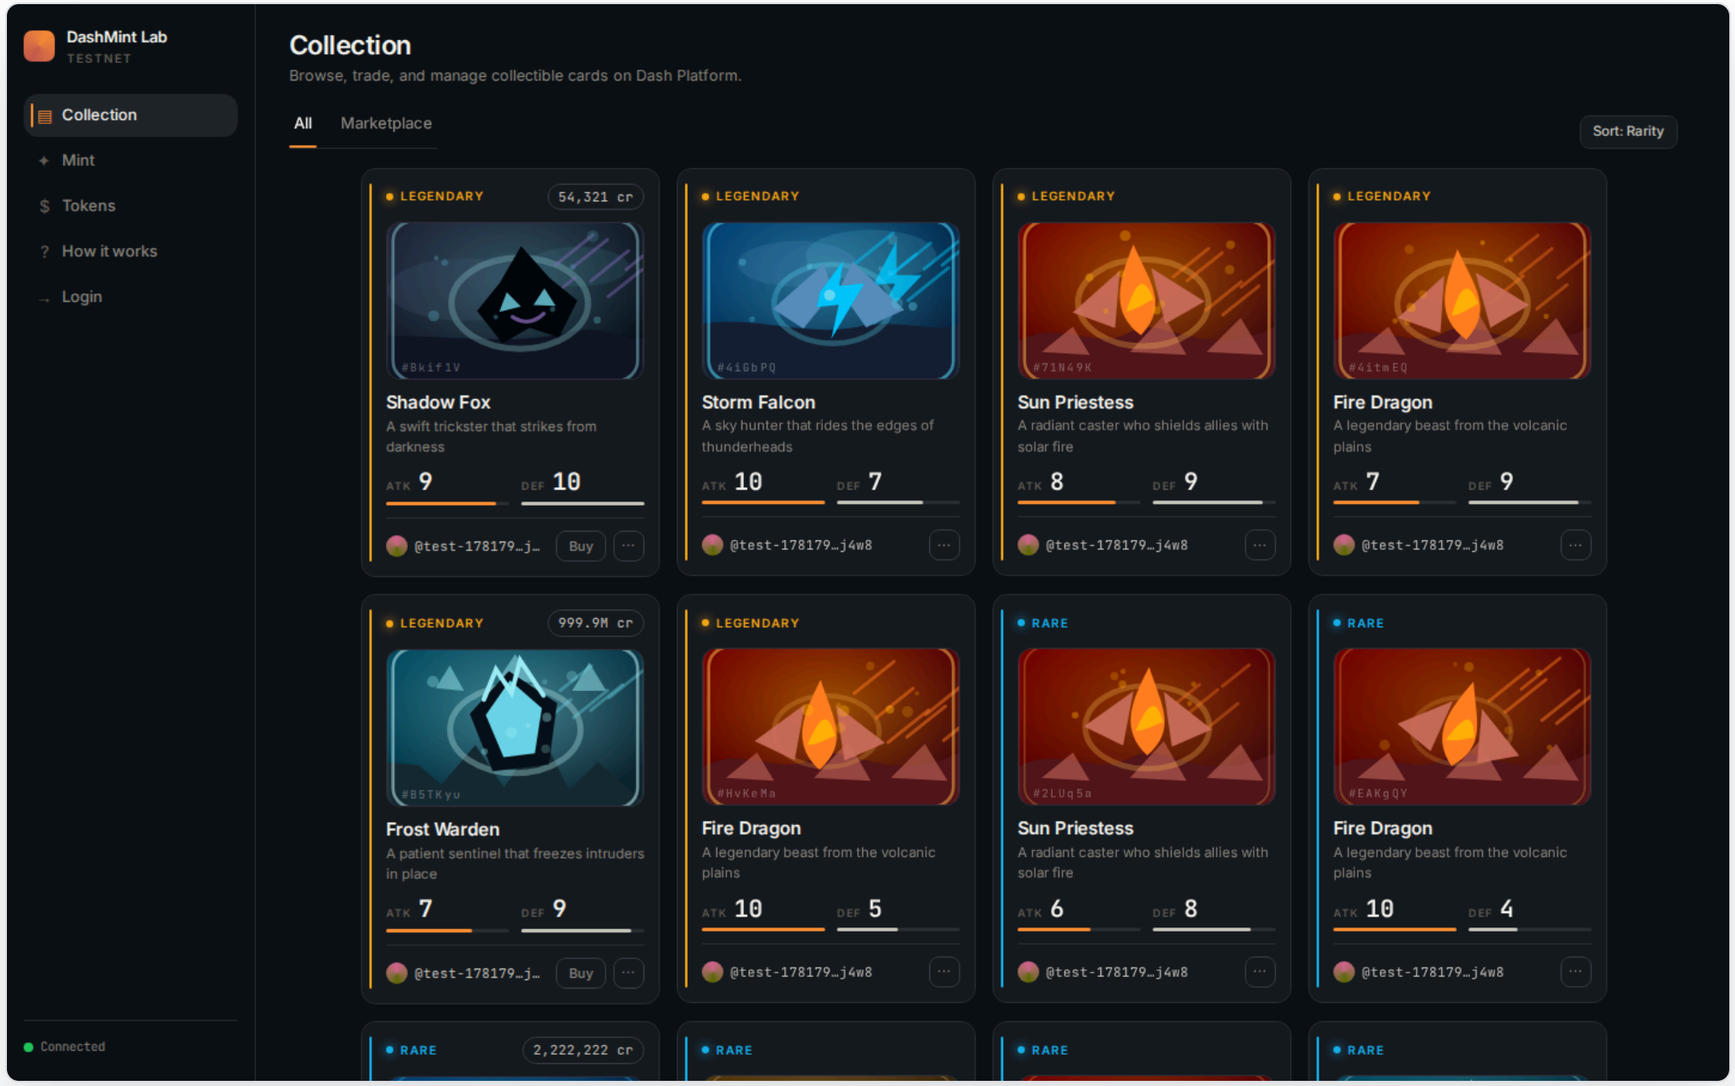

DashMint Lab

A collectible-card marketplace app where NFT-style documents can be minted, transferred, listed, purchased, and burned.

- Marketplace flows are document ownership changes.
- Prices turn owned documents into listings that other identities can purchase.
- A fixed-supply token controls minting capacity and can be transferred between identities.

> The core pattern is NFT-style document ownership plus token scarcity: cards move through marketplace actions, while tokens control who can create new supply.

documents.create **documents.transfer**
documents.setPrice **documents.purchase**
tokens.transfer **tokenPaymentInfo**

IDENTITY-OWNED DOCUMENTS

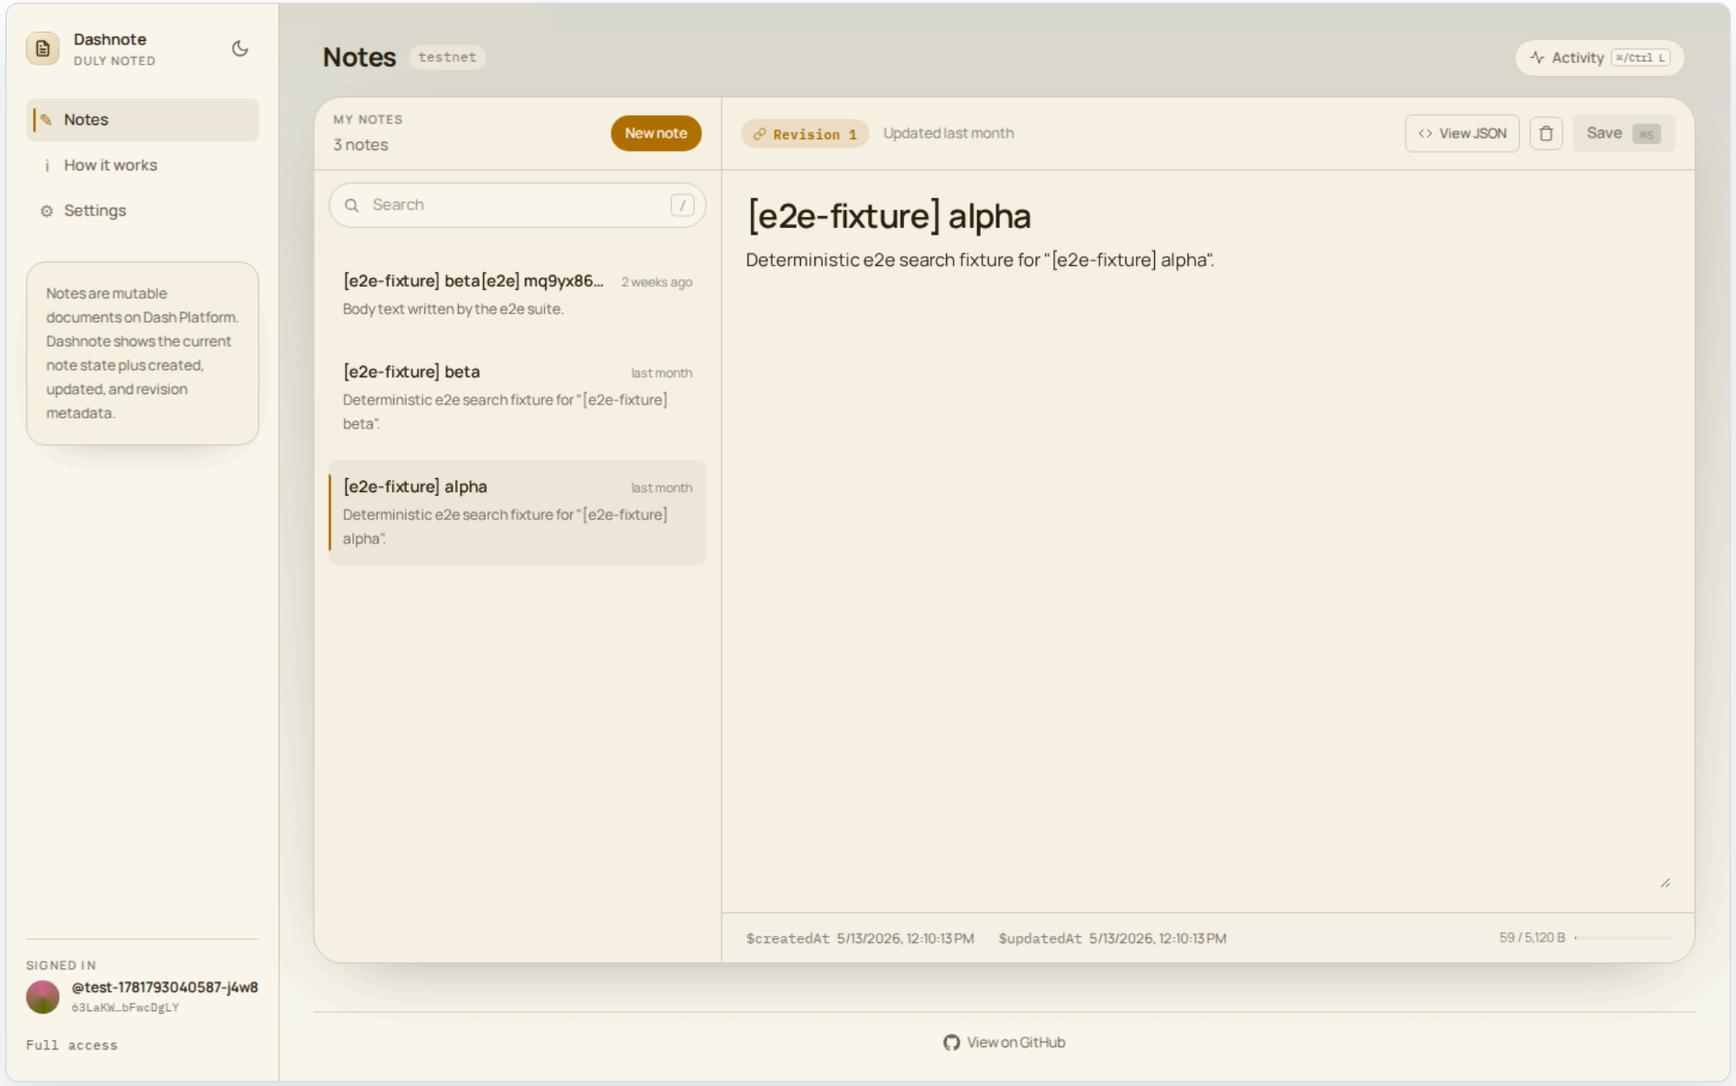

Dashnote

A notes app where entries belong to a Dash Platform identity, not a device, account database, or browser session.

- Notes are mutable Platform documents with owner-scoped indexes for fast retrieval.
- Any compatible client can read the same contract and render the same user-owned data.
- Revision numbers and Platform timestamps make edits explicit instead of hidden in app state.

> The special part is portability: identity-owned notes can move across apps while Platform handles document ownership, ordering, revision checks, and timestamp metadata.

documents.create **documents.query** **documents.replace** **documents.delete**

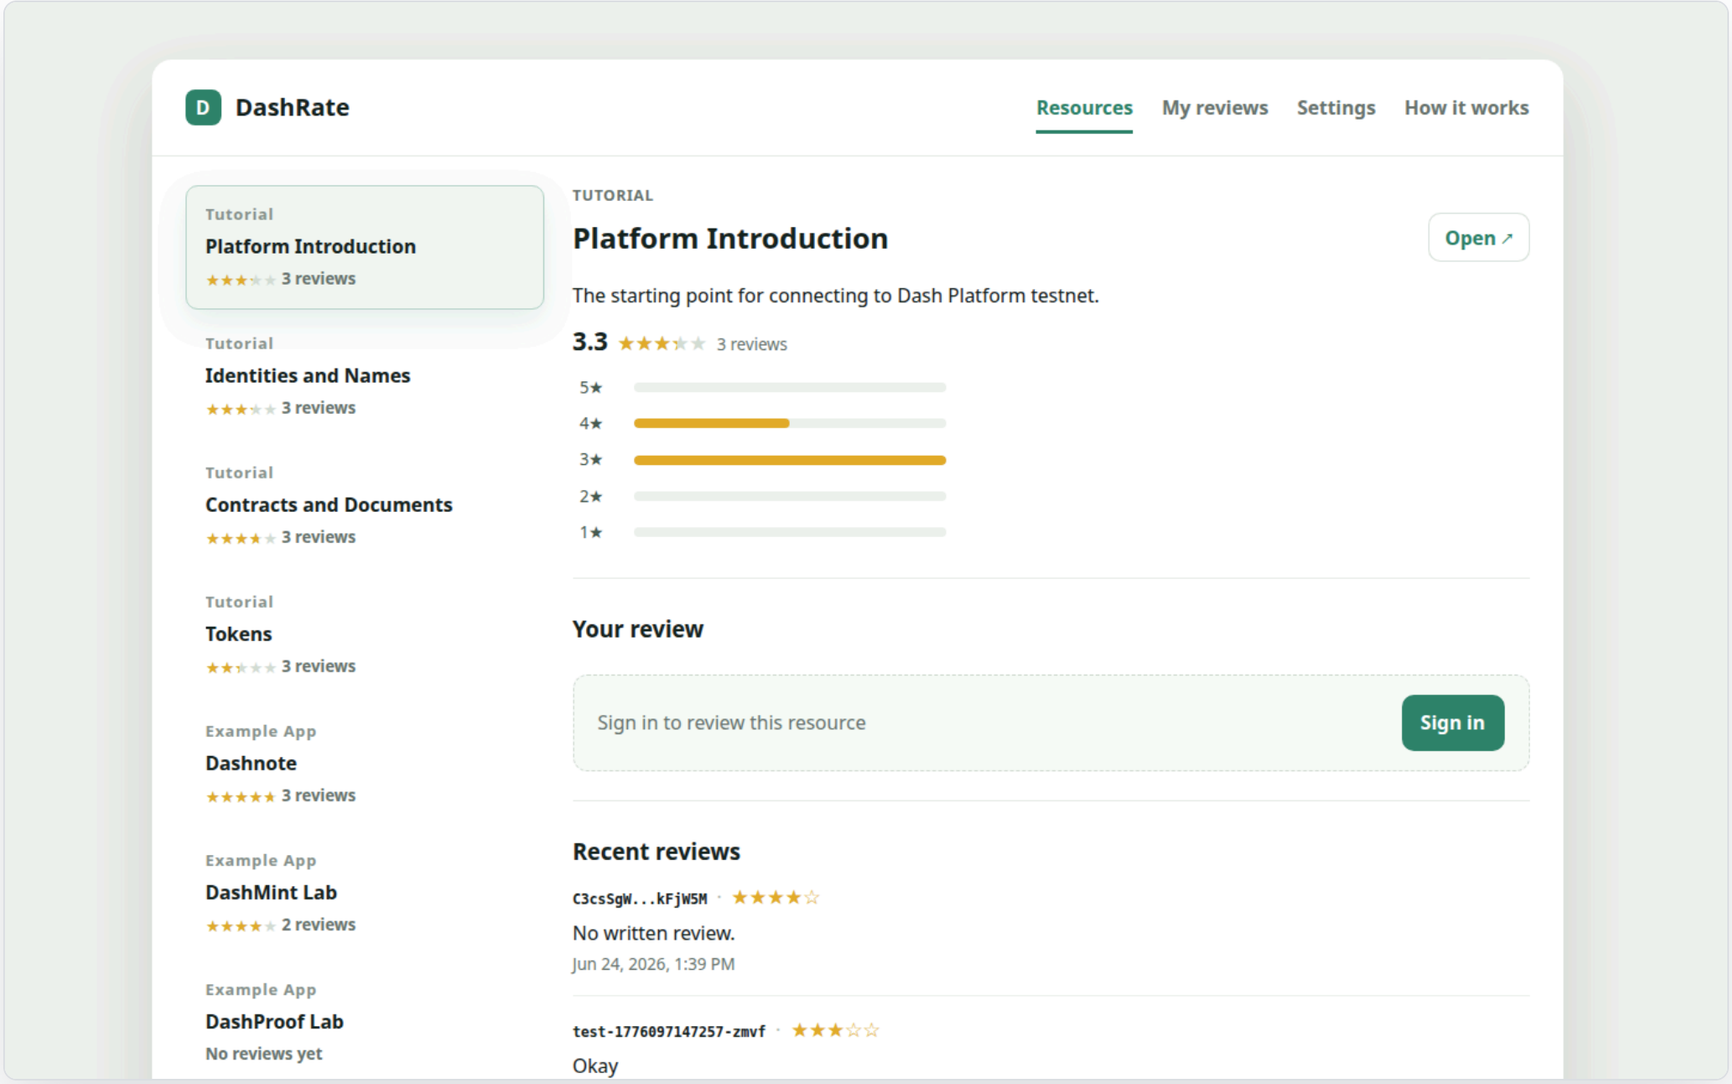

RATINGS AND AGGREGATE QUERIES

DashRate

A tutorial-resource ratings app centered on Platform v4 relational document queries and grouped counts.

- Read-only users can browse resources, aggregates, and recent reviews.
- Signed-in users can create one review per resource and edit it later.
- Count, grouped count, rating filters, and document history are visible in one UI.

documents.query **documents.count** **documents.history**

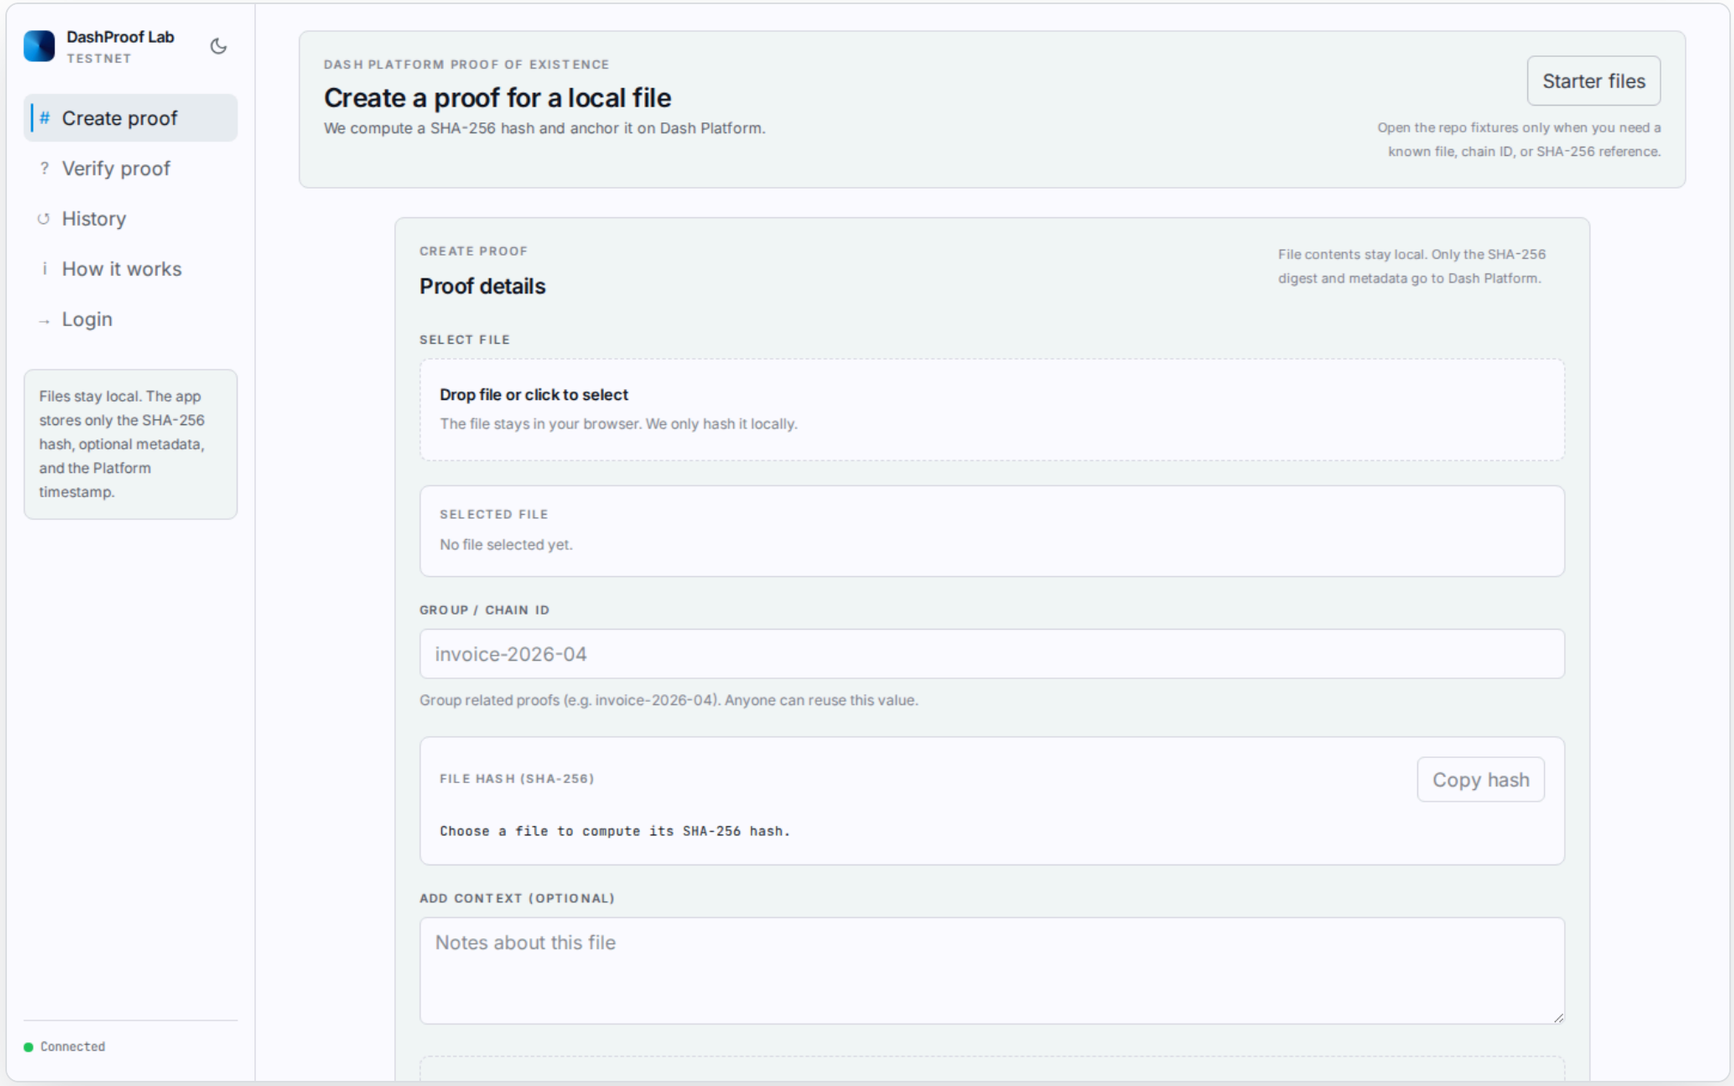

PROOF OF EXISTENCE

DashProof Lab

A file proof tutorial that keeps file contents local, hashes them in the browser, and anchors only the digest plus metadata on Platform.

- SHA-256 is computed locally before any Platform call.
- Users can verify a file by hash and review proof history by owner or chain ID.
- Starter files make the demo reproducible without uploading private files.

local hashing **unique hash index** **chain history**

HOW TO READ THE EXAMPLES

Same SDK, different learning goals.

Start with the narrow examples when learning an operation. Move to the polished apps when you need production-shaped state, auth, and UX patterns.

DashMint Lab

Best for NFT-style ownership flows and token-gated creation.

Dashnote

Starter-to-polished notes path: same contract, compatible data, richer UI.

DashRate

Best for indexes, aggregate counts, filtered reads, and history.

DashProof Lab

Best for local processing plus immutable proof records on Platform.
